About this pack

Northern Woodland collects 4 tree species that genuinely share a habitat, so a scene built from them reads as one place rather than an assortment. Every species ships in four variations - two sizes and three bark conditions - which gives you 16 distinct prefabs to scatter without the repetition being obvious.

Each variation is a separately grown model with its own bark condition, its own two materials and its own eight textures - not a tinted copy of a neighbour. Nothing is shared between them, so a single variation can be restyled or replaced without it propagating across the rest of the species.

Everything is modelled at real-world scale, so a stand of these sits correctly next to a character or a building with no rescaling, and the triangle range is wide enough to cover both background filler and a hero tree in shot.

At a glance

Species	4
Variations per species	4
Prefabs	16
Meshes	16, one per prefab
Triangles per tree	3,636 - 11,184
Tree height	12 - 23 metres
Texture resolution	2048 x 2048
Texture maps	128 (8 per prefab)
Materials	32 (bark and foliage per prefab)
Model format	FBX

Species in this pack

Triangle counts are for the finished mesh as it imports into Unity. Heights are the real modelled height in metres - these trees are built to scale, so they stand correctly next to a character controller without rescaling.

Tree	Species	Variations	Triangles	Height
Birch	<i>Betula pendula</i>	HealthyLarge, HealthySmall, WeatheredLarge, SunbleachedSmall	3,636 - 6,208	12 - 22 m
Aspen	<i>Populus tremula</i>	HealthyLarge, HealthySmall, WeatheredSmall, SunbleachedLarge	3,876 - 6,800	12 - 20 m
Elm	<i>Ulmus glabra</i>	HealthyLarge, HealthySmall, WeatheredLarge, LushSmall	3,660 - 7,040	13 - 23 m
Hazel	<i>Corylus avellana</i>	HealthyLarge, HealthySmall, WeatheredSmall, LushLarge	5,456 - 11,184	12 - 18 m

The four variations

Every species ships as a large and a small form, plus two bark conditions drawn from the three below. Which two, and at which size, differs from species to species - the combinations are spread deliberately so that a row of trees from this pack does not fall into a visible pattern.

Variation	What it is
Healthy	The baseline bark: even mid-tone colour, the reading you want for the bulk of a stand.
Lush	The darkest bark of the set. Damp, shaded, vigorous growth - good for north faces, valley floors and the interior of a wood.
Sunbleached	The palest bark. Sun-exposed and washed out, for open edges, ridgelines and clearings.
Weathered	The roughest and driest bark, with the heaviest surface detail. Old specimens, harsh sites, neglected ground.

Large is the mature, many-branched form. **Small** is the younger, lighter form - not a scaled copy but a separately grown model, with its own branching and its own silhouette.

Models

Format	FBX, one mesh per tree
Submeshes	Two - bark on the first, foliage on the second, so the two materials stay independently addressable
Scale	Real world metres. 1 Unity unit = 1 metre, no import scale factor
Orientation	Y up, pivot at the base of the trunk so trees sit on the ground plane
Hierarchy	A single GameObject with one mesh renderer
UVs	One channel, non-overlapping, no lightmap UVs generated
Normals	Imported from the source model
Tangents	Calculated on import, Mikktspace
Vertex colours	None
Rigging / animation	None. These are static meshes
Colliders	None, so you can fit your own
Read/Write	Disabled, so meshes do not keep a CPU-side copy

Triangle budget

The whole pack runs from 3,636 to 11,184 triangles per tree. The small forms sit at the bottom of that range and the large, dense-canopied forms at the top, so you can mix cheap background trees and detailed hero trees from the same set without them looking like they came from different packs.

Textures

Every prefab carries its own complete texture set - four maps for the bark and four for the foliage, all at 2048 x 2048. Nothing is shared between variations, which means you can retint or replace the foliage of one variation without it propagating across the rest of the species.

Map	Contents	Colour space
Base Colour	Albedo. The foliage atlas carries a hard-edged alpha channel for the leaf cutouts.	sRGB
Normal	Tangent-space surface detail - bark ridges, fissures and leaf veining.	Linear
Height	Greyscale displacement detail for the bark surface.	Linear
Metallic / Smoothness	Metallic in the red channel, smoothness in the alpha channel, packed the way Unity expects it.	Linear

Quality and authoring

Resolution	2048 x 2048 throughout - bark and foliage, every map
Source format	Lossless PNG. Nothing has been through a lossy pass
Bark tiling	Seamless along the trunk and branches
Foliage alpha	Binary, authored for a 0.5 clip threshold - no soft fringe and no halo when mipped
Mip coverage	Alpha coverage is preserved down the mip chain, so distant canopies do not thin out
Sets per pack	16 bark sets and 16 foliage sets
Total maps	128

The maps import at full 2048 resolution. If you are targeting mobile or want to trim build size, lower the maximum size on the texture importer - the source files stay untouched, so you can go back up at any time.

What you get

The pack imports into a single folder. Every variation lives in its own folder with the model, its two materials and its eight textures together, so moving, duplicating or deleting one variation never disturbs another.

Naming is uniform across every World Trees pack: **T_** for a texture, **M_** for a material, and every asset carries its species and variation in the name, so search in the Project window finds what you want on the first try.

Getting started

1. **Import the package.** Everything lands under **World Trees/Northern Woodland**.
2. **Open the Prefabs folder.** All 16 prefabs sit together in one place.
3. **Drag one into the scene.** Materials are already assigned. Nothing else to configure.

Every World Trees pack follows the same folder layout, naming and scale, so packs can be mixed freely in one project.
